COMMERCIAL BLUEPRINT & INVESTMENT MEMORANDUM

ICUMS LOGISTICS AUTOMATION PLATFORM

Project Codename: TradePulse AI / ICUMS Copilot

Target Market: Ghana Trade & Customs (Tema & Takoradi Ports)

Document Date: August 2026

EXECUTIVE SUMMARY

This blueprint presents an AI-driven, commercial software solution designed to eliminate manual data entry, streamline document generation (IDF & Bill of Entry drafts), and provide real-time tracking for the Integrated Customs Management System (ICUMS) in Ghana. Operating on a **Hybrid Architecture (Desktop Web Dashboard + Mobile Companion App)**, this system solves critical operational bottlenecks for Customs House Agents (CHAs) and freight forwarders, directly preventing demurrage penalties and reducing processing times by up to 90%.

1. MARKET PROBLEM VS. BUSINESS SOLUTION

Ghanaian clearing agents, freight forwarders, and importers currently face severe operational friction when navigating the ICUMS trade portal:

Current Market Pain Points	Proposed Platform Solution
Manual Data Entry Errors: Clearing agents manually type 50+ line items from Commercial Invoices and Packing Lists into ICUMS, taking 1 to 3 hours per declaration.	**AI Document Extraction (OCR + LLM):** Upload invoice PDFs. Claude Vision parses FOB values, HS codes, weights, and items into structured JSON in under 30 seconds.
Demurrage & Storage Fines: Missed status changes (e.g., duty assessments, scan flags) lead to container delays and costly port demurrage fees at Tema Port.	**Real-Time Automated Push Alerts:** Background engines track BoE numbers 24/7 and fire instant lock-screen mobile alerts (FCM/WhatsApp) on status shifts.
Lack of Port Mobility: Agents out at MPS Terminals or Golden Jubilee cannot monitor declaration changes without constant manual portal refreshes.	**Mobile App Integration:** Mobile companion app keeps field agents synchronized with office staff, sending instant alerts even during Gate-In / Scanning.

2. SYSTEM ARCHITECTURE & CORE CAPABILITIES

A. The Dual-Interface Hybrid Model

To maximize efficiency, the platform employs a dual interface tailored to agent workflows:

- **Desktop Web Dashboard (Next.js / React):** Used by office staff for heavy document handling—drag-and-drop PDF uploads, split-screen data verification, and batch IDF/BoE generation.
- **Mobile Companion App (Flutter - iOS & Android):** Used by field agents at the port for real-time status notifications, quick BoE lookup, and mobile approval triggers.

B. End-to-End Workflow Pipeline

1 2 3 4

Document Upload	AI Processing	Auto-Filing	24/7 Alerts
Agent uploads Commercial Invoice & Packing List (PDF/ Image) via Web App.	Claude Vision extracts HS Codes, FOB, Quantities, and Supplier Data.	Automation engine stages data into ICUMS Declarant forms in seconds.	Background bot checks BoE state; fires SMS/Push notifications on change.

3. STRATEGIC ADDITIONS & OPERATIONAL ESSENTIALS

To ensure commercial success, compliance, and enterprise resilience, the following operational components are built directly into the system architecture:

Key Technical & Operational Rules:

- **ICUMS Portal Integration Target:** Operates entirely on the *Declarant Front-End (`external.unipassghana.com`)*—no access required to internal GRA Customs Officer portals.
- **Human-in-the-Loop Validation:** Features a side-by-side verification interface before final submission to eliminate compliance risks and ensure 100% HS Code accuracy.
- **Security & Credential Vault:** Implements AES-256 bank-grade encryption to safeguard agency TINs, passwords, and client commercial invoices.
- **Anti-Captcha & Session Handling:** Employs persistent session management and proxy rotation to prevent IP blocking and maintain 24/7 monitoring uptime.

4. FINANCIAL MODEL & MONETIZATION STRATEGY

The product provides two lucrative revenue streams targeting registered Customs House Agents (CHAs), GIFF/ CUBAG freight forwarders, and enterprise importers:

Revenue Tier	Target Client	Pricing Structure	Est. Revenue Potential
1. Pay-Per-Filing	Independent Clearing Agents & Small Brokers	GH₵30 – GH₵50 ($2 – $4) per auto-generated document (IDF / BoE)	High volume transactional cash flow
2. SaaS Subscription	Medium to Large Freight Forwarding Agencies	GH₵800 – GH₵1,500 ($50 – $100) / month per agency (Unlimited Tracking & AI)	Predictable monthly recurring revenue (MRR)

5-Year Strategic Business Projection

Commercial Scaling Strategy:

By onboarding just **25 active clearing agencies** in Year 1 at an average of $100/month, the platform generates **$2,500 MRR ($30,000/year)** against operating costs of under $50/month. At Year 3 (100+ agencies), the business reaches a valuation of **$150,000 – $300,000+**, positioning it for either sustained dividend distributions or an acquisition by a major logistics enterprise.

5. IMPLEMENTATION ROADMAP

Phase	Timeline	Key Deliverables
Phase 1	Weeks 1 – 2	**Tracking Engine & Push Alerts (MVP):** Build background ICUMS scraper, status change detector, and Firebase push notifications.
Phase 2	Weeks 3 – 4	**AI Document Parser:** Develop Claude Vision PDF extraction pipeline for Commercial Invoices, Packing Lists, and IDF fields.
Phase 3	Weeks 5 – 6	**Auto-Filler Engine & Mobile UI:** Integrate Puppeteer form auto-filling and complete Flutter mobile companion app.
Phase 4	Weeks 7 – 8	**Pilot Testing & Commercial Launch:** Onboard 3 local Tema agencies for live beta testing and convert to paid plans.
